

IN THE SPECIFICATION

Please amend the paragraph beginning at page 7, line 21, as follows:

In principle, it would be possible, with the method according to the invention, to produce for each pane a fashioned part individually suited to its curvature, which does not bond to the pane and which serves as a free "intermediate layer" for a subsequent assembly common with the support part. In preference, the ~~support~~ fashioned part however bonds directly with the pane in such a way as to constitute a unit comprising the pane and the support part. According to an advantageous variant, it constitutes on the pane a reference or contact face correctly oriented in the region of assembly between the pane and the support part, which cooperates with a corresponding opposite face of the support part.

Please delete the paragraph beginning at page 10, line 6, in its entirety.
